

SMARC T335X Hardware Design

VIN_PWR_BAD#:

Can VIN_PWR_BAD# be pulled up to VDD_MOD? In other words is an OVP and UVP IC required?

SMARC defines the input power source to be 3V~5.25V. Once you can assure the power of SMARC module is good, you can decide yourself the voltage level to be pulled up. It does not matter if there is ovp or uvp.
